The Lower Mainland's soft water is great for drinking and cleaning... but it's bad news for copper pipes.

It slowly corrodes the interior pipe walls and produces **pinhole leaks**. That's when problems really start. And it's inevitable! Building water pressure fluctuations and municipal chlorine levels just aggravate the problem and speed up the process.

The good news is the problem is preventable. And it's curable. An application of the CuraFlo Epoxy Lining to existing plumbing systems stops leaks dead. It's a proven, safe, practical, AND cost-effective solution. CuraFlo Epoxy bonds to the interior wall of the copper piping, forming a smooth, extremely strong, totally inert interior surface that will not break down or erode. Water flow is immediately

improved and leaks are permanently repaired – and the original cause of the leaks is no longer an issue. Unlike repiping, our CuraFlo professionals won't tear into huge sections of walls, floors, or ceilings – they just need limited access to the plumbing. The CuraFlo **environmentally friendly process** minimizes prep, saves time, cuts down on waste, and simplifies final finishing and cleanup.

Avoid A Water Crisis.

The CuraFlo Engineered Flow Lining System™

PRODUCTS

SAFE, RESTORED PLUMBING SYSTEMS WITHOUT TEARING OUT WALLS.

The CuraFlo Engineered Flow Lining System restores deteriorating water pipes in a variety of buildings including multi-tenant apartment complexes, institutional buildings, and residential homes.

CuraFlo's process involves lining the pipes with a safe durable epoxy coating technology that is suitable for metal pipes ranging from 1/2" to 4" in diameter. CuraFlo's proprietary epoxy, CuraPoxy®, is certified to meet safe NSF drinking water standards in applications up to 180°F.

Line Your Pipes Instead of Replacing Them

Traditional rehabilitation for pipe problems such as corrosion, leaks and poor water flow has been pipe replacement. This is a costly and invasive option requiring the removal of walls, floors and/or ceilings to access the pipes. CuraFlo's Engineered Flow Lining System cleans and lines pipes with a safe, durable epoxy coating. Pipes are accessed through specific location points, minimizing the need to tear out existing pipes.
